COMMUNITIES • EVENTS • ACHIEVEMENTS

GuildOS

A comprehensive platform overview

What the website does, who it serves, its advantages, and the boundaries of its verification and external-platform features.

01 What GuildOS is

- GuildOS is a community, event, and career platform for students, campus organizations, and professional communities.
- It connects community membership, events, attendance, projects, leadership, certificates, and career opportunities.
- Its central purpose is to help people organize activities, record participation, and turn those activities into a credible track record.

02 Who the website serves

- Students and members: discover communities, attend events, build projects, earn certificates, and find opportunities.
- Community organizers: manage members, leadership, events, attendance, finances, and records.
- Schools and institutions: gain a clearer record of community activities and student involvement.
- Sponsors: discover events to support and review delivery reports.
- Recruiters: publish opportunities and discover candidates using their profiles and recorded achievements.
- Platform administrators: oversee verification, moderation, payments, and access.

03 Community creation and management

- Organizations can create a community page with their identity, description, interests, and contact information.
- Students can discover, follow, and join communities.
- Organizers can handle membership requests and manage existing members.
- Different leadership roles provide different permissions.
- Communities can connect their existing WhatsApp, Discord, Telegram, Slack, or other community spaces.
- This allows GuildOS to work alongside the platforms a community already uses.
- Unverified communities have a restricted set of capabilities until verification is completed.

04 Community Mode and organizer access

- Student participation and organizer access are separate.
- Community Mode requires personal approval before protected organizer tools become available.
- Approval alone does not give someone control over another community; they also need the appropriate active membership and role.
- Removed or suspended members should not retain management authority through an old role.
- A community's verification status is separate from an individual organizer's approval.
- Sensitive features, including certificates and paid-event capabilities, retain their additional verification requirements.

05 Leadership records and succession

- Communities can maintain leadership rosters for different academic sessions or terms.
- They can record names, positions, and service periods.
- Leadership lists can be imported from supported documents for review.
- Outgoing leadership can be recorded as past leadership.
- Organizers can hand responsibilities to incoming leaders and transfer ownership where appropriate.
- Eligible leadership service can receive verifiable certificates and contribute to the member's record.
- This helps a community retain its history when executives graduate or leave.

06 Event planning and publishing

- Organizers can create workshops, seminars, meetups, hackathons, and other events.
- Events can be physical, online, or hybrid.
- Event pages can include descriptions, schedules, venues, speakers, volunteers, partners, and sponsors.
- Registration can support capacity limits, approval requirements, invitations, and waitlists.
- Organizers can collect event-specific registration answers.
- Multi-day events can have separate daily schedules and attendance requirements.
- Parallel sections or tracks can have their own venues, trainers, and capacity.
- Previous events can be copied into new drafts to reduce repeated setup work.
- Events can be postponed, rescheduled, or canceled through the relevant organizer flows.

07 Student event discovery and registration

- Students can browse events and filter them by relevant categories, location, format, and other available options.
- They can save events and add them to their calendars.
- GuildOS keeps their account identity available across events, reducing repeated profile entry.
- Each event still has its own registration and eligibility requirements.
- A confirmed registration that stays on GuildOS displays a success popup.
- Its Discover more events button prioritizes similar topics and event types.
- Waitlisted and approval-pending students receive the appropriate pending status instead of a confirmed-registration message.

08 Support for events hosted on other platforms

- Communities can continue using an external registration platform required by a company, school, or parent organization.
- An organizer can paste a public event link and preview details extracted from that page.
- Extracted information must be reviewed before saving.
- GuildOS can save the student's registration and direct them to the official external registration page.
- Students are encouraged to use their GuildOS email on that external site.
- A Copy email button makes this easier.
- Students who used another email can expand the alternate-email option and verify ownership of that address.
- Organizers can import registration and attendance reports, with records matched against verified member emails.
- Unmatched records remain available for review and rechecking.

09 Clear external-registration statuses

- GuildOS distinguishes a student opening the external page, a student reporting that they completed registration, and registration matched against an organizer's report.
- Opening a link does not prove registration was completed.
- Verifying another email proves ownership of that email; it does not prove event registration or attendance.
- Direct confirmation through external-platform APIs or webhooks is not included in the current external-event flow.

10 Attendance recording

- GuildOS-managed events support check-in and check-out workflows, including QR-based attendance.
- Online events have their relevant joining and attendance flows.
- Multi-day events can track attendance separately for each day.
- Certificate eligibility can consider attendance duration and required days.
- Events using external attendance reports do not require students to repeat check-in and check-out in GuildOS.
- Organizers can review attendance records and import supported CSV or TSV reports.
- Matching uses verified emails rather than guessing from names.
- Import rules help prevent duplicate duration counting and inappropriate changes to existing attendance or issued certificates.

11 Public event transparency

- Event pages show confirmed registration totals.
- Attendance totals remain pending until the event has ended and attendance is finalized.
- Finalized totals distinguish attendance from registration.
- Attendance sources are labeled, including GuildOS check-in and organizer-uploaded reports.
- Public totals provide visibility without exposing attendee email lists.
- Private-event access restrictions still apply.
- These figures help students and sponsors assess participation, while the source labels explain the evidence behind them.

12 Certificates and verification

- Eligible participants can receive certificates linked to their recorded activity.
- Certificates have unique serial numbers and QR verification links.
- Anyone receiving a certificate link can check its corresponding GuildOS record.
- Organizers have certificate templates and customization tools.
- Depending on the available entitlement, customization can include wording, colors, fonts, signatures, and other design elements.
- Certificates can include relevant community, partner, or sponsor branding.
- The platform supports attendance, leadership, and hackathon-related certificate flows.
- Organizer-imported attendance remains labeled as organizer-reported evidence.
- Certificate verification confirms the recorded credential; it does not independently authenticate the origin of an uploaded spreadsheet.

13 Hackathon management

- Participants can create or join teams.
- Teams can submit project descriptions, repository links, demos, videos, images, and technology information.
- Organizers can configure tracks and judging criteria.
- Invited judges can review and score submissions through their judging pages.
- Organizers can review every submitted project from their dashboard.
- Organizers choose and publish the winners.
- The public hackathon page shows winning projects only after results are published.
- Teams retain private access to their own submissions.
- Winning projects can be saved to the community's Knowledge Hub.
- Eligible participants and winners can receive the relevant achievements and certificates.

14 Guild Score and member reputation

- Guild Score records contributions across supported activities.
- These can include attendance, leadership, organizing, speaking, volunteering, hackathon work, and knowledge contributions.
- The score has an activity ledger so members can understand where points came from.
- Verification and eligibility rules determine which activities qualify.
- It helps make consistent participation and contribution more visible.
- Guild Score is an activity-based reputation signal; it is not a complete measure of someone's ability or employability.

15 Profiles, portfolios, and CVs

- Members can maintain profiles showing their interests, skills, communities, and achievements.
- Recorded certificates, leadership, and project activity can support their public professional identity.
- The CV builder can assemble information from their GuildOS history.
- AI assistance can help improve presentation and wording.
- Public CV verification links let others compare supported claims with platform records.
- Users can refresh a CV when their activity record changes.
- External credentials can be added but remain distinguished from GuildOS-verified records.
- This helps students build evidence of involvement alongside their academic qualifications.

16 Opportunities and recruitment

- Students can discover opportunities and record actions such as saving, expressing interest, or applying.
- Matching can use relevant profile information and platform activity.
- Recruiters have a dedicated portal for publishing and managing opportunities.
- Recruiters can review candidates and move them through an applicant pipeline.
- Candidate discovery supports filters such as institution, department, leadership, reputation, and availability.
- Recruiter verification and opportunity moderation provide additional trust signals.
- Recruiters can view analytics for their listings and candidate activity.
- These tools support discovery and review; they do not guarantee selection or employment.

17 Sponsorship

- Organizations and brands can discover events seeking sponsorship.
- Sponsors can submit inquiries or offers.
- Organizers can manage discussions and record sponsorship agreements and deliverables.
- Supported sponsorships can be paid through GuildOS.
- Relevant branding can appear on event pages, certificates, and thank-you content.
- Sponsor reports can show participation figures, attendance evidence, and feedback.
- Reports distinguish GuildOS-recorded attendance from organizer-uploaded attendance.
- This gives sponsors a more structured way to evaluate what an event delivered.

18 Paid tickets and organizer finances

- Verified, eligible communities can run paid events.
- Ticketing supports features such as tiers, promotional codes, group purchases, and discounts.
- Group purchases can provide individual claim links for attendees.
- Organizers can review sales and their community wallet.
- Payout and refund workflows support the financial side of events.
- Supported payment providers include Paystack and Flutterwave.
- Actual availability depends on the configured provider, community eligibility, and platform settings.
- Platform revenue can come from ticket commissions, sponsorship fees, and premium customization.

19 Communication and engagement

- Members and communities can publish posts and updates.
- Feeds support engagement through comments, reactions, and polls.
- Communities can publish announcements.
- Notifications help members follow registrations, events, certificates, and other relevant activity.
- Messaging and connection features help members maintain relationships.
- Sharing event and achievement links helps communities reach more people.
- Post-event feedback helps organizers understand attendee experiences.

20 Knowledge Hub and AI assistance

- Communities can preserve articles, links, files, guides, and useful resources.
- This helps retain institutional knowledge across leadership changes.
- Members can discover relevant knowledge through search.
- The assistant can use supported community resources, event information, and the member's accessible records.
- AI tools also support areas such as CV wording, event planning, and feedback summaries.
- AI output still needs judgment and review, especially when importing or drafting information.

21 Advantages for students

- One place to discover communities, events, projects, and opportunities.
- Less repeated profile entry.
- Easier access to personal event records and certificates.
- A clearer history of participation and leadership.
- More evidence to support a CV or portfolio.
- A way to recover report matches when an external platform uses another email.
- Opportunities to gain visibility through contributions beyond exam results.

22 Advantages for organizers and institutions

- Fewer disconnected spreadsheets and manual certificate processes.
- Membership, leadership, events, attendance, and reporting connected in one platform.
- Continued use of existing chat communities and required external event platforms.
- Better continuity when leadership changes.
- More structured sponsor communication and reporting.
- Clearer permission boundaries for community management.
- A distinction between registration numbers, actual attendance, and the source of attendance evidence.

23 What makes GuildOS distinctive

- Its value comes from connecting the full journey: community → event → participation → achievement → profile → opportunity.
- Event activity remains useful after the event ends.
- Community leadership becomes part of a lasting record.
- External-platform support reduces the need for organizations to abandon their existing tools.
- Evidence labels make the strength and origin of a record clearer.
- It brings organizer operations and student development into the same system.

24 Current limits and important boundaries

- External registration cannot be confirmed merely by decoding or opening a link.
- Event-link extraction depends on what the source website makes publicly accessible.
- Uploaded reports remain organizer-reported evidence.
- Some mismatches require verification and organizer review.
- Email, payment, storage, and AI features depend on their configured services.
- The native mobile app is still at an early stage.
- The platform improves traceability and accountability, but it cannot eliminate every false claim or form of attendance fraud.
